

Using the GlassRenu® CDT Conditioning RenuDisk®

All RED RenuDisks are made with a new type of abrasive material that actually transforms the grinding disk into a prepolish disk the more it is used. These special conditioning disks will leave the surface of the glass clearer and allow the damage to polish out faster than ever before.

Step 1: RED Disks are the most aggressive RenuDisk we manufacture and should be used on heavy or extreme damage.

Use as a grinding disk for approximately 250 sq. ft. of damage removal.

When the disk is ready to be used as a pre-polish disk it will retain glass stock within the paper, take on a reflective shimmer and feel extremely smooth. If you still feel a rough or abrasive quality to the surface of the disk continue to use it for grinding.

Step 2: Once the RED disk has achieved the 'pre-polish' condition, you may use the disk to prep the repair area for polishing. The goal is to get the glass surface to look "splotchy" and uniformly hazed. To do this, set the grinder to a speed setting of 5 and work the entire area of the repair. Insure that you exceed the previously ground area by a half diameter of the disk being used. Once the glass is uniformly pre-polished, continue on to the polishing step as you normally would.
